USER DOCUMENTATION

GALAHAD Optimization Library version 5.0

## 1 SUMMARY

This package defines a derived type capable of **supporting a variety of sparse matrix storage schemes**. Its principal use is to allow exchange of data between GALAHAD subprograms and other codes. The derived type is structurally equivalent to the type `ZD11_type` available from the HSL package `ZD11`.

**ATTRIBUTES — Versions:** `GALAHAD_SMT_single`, `GALAHAD_SMT_double`. **Uses:** None. **Date:** March 1998. **Origin:** N. I. M. Gould and J. K. Reid, Rutherford Appleton Laboratory. **Language:** Fortran 95 + TR 15581 or Fortran 2003.

## 2 HOW TO USE THE PACKAGE

The package is available using both single and double precision reals, and either 32-bit or 64-bit integers. Access to the 32-bit integer, single precision version requires the `USE` statement

```
USE GALAHAD_SMT_single
```

with the obvious substitution `GALAHAD_SMT_double`, `GALAHAD_SMT_single_64` and `GALAHAD_SMT_double_64` for the other variants.

If it is required to use more than one of the modules at the same time, the derived type `SMT_type` (Section 2.2), the subroutine `SMT_put`, and the function `SMT_get` (Section 2.3) must be renamed on one of the `USE` statements.

### 2.1 Real and integer kinds

We use the terms integer and real to refer to the fortran keywords `REAL(rp_)` and `INTEGER(ip_)`, where `rp_` and `ip_` are the relevant kind values for the real and integer types employed by the particular module in use. The former are equivalent to default `REAL` for the single precision versions and `DOUBLE PRECISION` for the double precision cases, and correspond to `rp_ = real32` and `rp_ = real64`, respectively, as supplied by the fortran `iso_fortran_env` module. The latter are default (32-bit) and long (64-bit) integers, and correspond to `ip_ = int32` and `ip_ = int64`, respectively, again from the `iso_fortran_env` module.

### 2.2 The derived data type

A single derived data type, `SMT_type`, is accessible from the package. It is intended that, for any particular application, only those components which are needed will be set. The components are:

`id` is an allocatable array of rank one and type default `CHARACTER` that may be used to hold the name of the matrix.

`type` is an allocatable array of rank one and type default `CHARACTER` that may be used to hold a key which indicates the type (or kind) of the matrix in question.

`m` is a scalar component of type `INTEGER(ip_)` that may be used to hold the number of rows in the matrix.

`n` is a scalar component of type `INTEGER(ip_)` that may be used to hold the number of columns in the matrix.

`ne` is a scalar component of type `INTEGER(ip_)` that may be used to hold the number of entries in the matrix.

**All use is subject to the conditions of a BSD-3-Clause License.**

See <http://galahad.rl.ac.uk/galahad-www/cou.html> for full details.

- `row` is an allocatable array of rank one and type `INTEGER(ip_)` that may be used to hold the row indices of the entries of the matrix.
- `col` is an allocatable array of rank one and type `INTEGER(ip_)` that may be used to hold the column indices of the entries of the matrix.
- `val` is an allocatable array of rank one and type `REAL(rp_)` that may be used to hold the numerical values of the entries of the matrix.
- `ptr` is an allocatable array of rank one and type `INTEGER(ip_)` that may be used to hold the starting positions of each row in a row-wise storage scheme, or the starting positions of each column in a column-wise storage scheme.

### 2.3 Argument lists and calling sequences

To assist use of the character arrays in the components `%id` and `%type`, the module provides two procedures:

1. The subroutine `SMT_put` allocates a character array and sets its components from a character variable.
2. The function `SMT_get` obtains the elements of a character array as a character variable.

We use square brackets [ ] to indicate `OPTIONAL` arguments.

#### 2.3.1 Allocate a character array and set its components

To allocate a character array and set its components from a character variable,

```
CALL SMT_put( array, string, stat )
```

`array` is a rank one allocatable array of type default `CHARACTER`. If `string` is present, `array` is allocated with size `LEN_TRIM(string)` and its elements are given the values `string(i:i)`,  $i = 1, 2, \dots$ ; otherwise, `array` is allocated to be of size zero.

`string` is an `OPTIONAL, INTENT(IN)` argument of type `CHARACTER` with any character length.

`stat` is an `INTENT(OUT)` argument of type `INTEGER(ip_)`. An `ALLOCATE` statement with this as its `STAT=` variable is executed and a successful allocation will be indicated by the value zero.

#### 2.3.2 Obtain the elements of a character array as a character variable

To obtain the elements of a character array as a character variable,

```
string = SMT_get( array )
```

`array` is an `INTENT(IN)` array of rank one and type default `CHARACTER`. It is not altered.

The result is scalar and of type `CHARACTER(LEN=SIZE(array))`. `SMT_get(i:i)` is given the value `array(i)`,  $i = 1, 2, \dots, \text{SIZE}(\text{array})$ .

## 3 GENERAL INFORMATION

**Other modules used directly:** None.

**Input/output:** None.

**Portability:** ISO Fortran 95 + TR 15581 or Fortran 2003. The package is thread-safe.

---

**All use is subject to the conditions of a BSD-3-Clause License.**

**See <http://galahad.rl.ac.uk/galahad-www/cou.html> for full details.**

## 4 EXAMPLE OF USE

Suppose that we wish to store the symmetric matrix

$$\begin{pmatrix} 1.0 & & \\ & 1.0 & \\ & & 1.0 \end{pmatrix},$$

whose name is “Sparse”, using a coordinate sparse matrix storage format. Then the following code is appropriate:

```
PROGRAM GALAHAD_SMT_example
USE GALAHAD_SMT_double
INTEGER :: i
TYPE ( SMT_type ) :: A
A%n = 3 ; A%ne = 2
ALLOCATE( A%row( A%ne ), A%col( A%ne ), A%val( A%ne ) )
CALL SMT_put( A%id, 'Sparse' )      ! Put name into A%id
CALL SMT_put( A%type )              ! Allocate space for A%type
A%row( 1 ) = 1 ; A%col( 1 ) = 1 ; A%val( 1 ) = 1.0
A%row( 2 ) = 2 ; A%col( 2 ) = 3 ; A%val( 2 ) = 1.0
WRITE( 6, "( 3A, I2, //, A )" ) ' Matrix ', SMT_get( A%id ), &
    ' dimension', A%n, ' row col value '
DO i = 1, A%ne
    WRITE( 6, "( I3, 1X, I3, ES9.1 )" ) A%row( i ), A%col( i ), A%val( i )
END DO
DEALLOCATE( A%id, A%row, A%col, A%val )
END PROGRAM GALAHAD_SMT_example
```

This produces the following output:

```
Matrix Sparse dimension 3
```

```
row col value
1 1 1.0E+00
2 3 1.0E+00
```

For examples of how the derived data type `packagename_problem_type` may be used in conjunction with the GALAHAD linear equation solver, see the specification sheet for the package `GALAHAD_SILS`.
